

PROJECT REPORT

Implement Client Script & UI Policy (Incident)

PROJECT METADATA

Team ID: SWTID-2026-4815
Team Size: 4 Members
Domain: IT Service Management (ITSM)

TEAM ROSTER

Leader: Harish Harish
Member 1: Kamalakkannan
Member 2: B. Tholkapiyan
Member 3: Tamil Inban

Executive Summary: This project focuses on implementing robust Client Scripts and UI Policies within the Incident Management module to automate form behavior, enforce data integrity, and enhance user experience dynamically based on user interactions.

Project Lifecycle Phases (Part 1)

Phase 1 Brainstorming & Ideation

Conducted initial sessions to identify key pain points in incident handling. Formulated requirements for dynamic field visibility, mandatory checks, and real-time form validation rules.

Phase 2 Requirement Analysis

Analyzed ServiceNow platform limitations and form object APIs. Defined exact trigger conditions for UI policies and script execution contexts (onChange, onLoad, onSubmit).

Phase 3 Project Design

Designed workflow schematics, data flow charts, and logic mapping for client-side scripts to ensure optimal browser performance without unnecessary server trips.

Phase 4 Project Planning

Established timeline milestones, task distribution among team members, code review checkpoints, and deployment strategies across sub-production instances.

Project Lifecycle Phases (Part 2)

Phase 5 Project Development

Developed custom Client Scripts utilizing GlideForm (g_form) and GlideUser (g_user) APIs. Configured comprehensive UI Policies for conditional field masking, read-only states, and mandatory enforcement.

Phase 6 Project Testing

Performed rigorous unit testing, negative testing, and cross-browser validation. Verified script execution order, asynchronous GlideAjax performance, and UI Policy conflict resolutions.

Phase 7 Documentation

Compiled comprehensive technical documentation, script catalogs, configuration guides, and user manuals to facilitate seamless handoff and future maintenance.

Phase 8 Demonstration

Presented the fully implemented solution to stakeholders, demonstrating live incident form automation, dynamic validation alerts, and responsive UI behaviors.

Conclusion & Key Outcomes

The successful execution of this project has significantly streamlined the Incident Management data-entry workflow. By leveraging efficient Client Scripts and declarative UI Policies, agents experience minimized manual errors, faster resolution inputs, and a cleaner, context-aware interface.

Sign-off Status: Approved and deployed successfully across target environments under team identifier **SWTID-2026-4815**.
